

Greater C a Valley Multi-Species Connectivity Field Survey (live layer)

Edit

This map displays real-time submissions from the Survey123 field form, plotted by GPS location across the Greater C a Valley study sites. Each point represents a single field visit and can include multiple nested records:

Species observations: functional group (large herbivores, decomposers, apex predators, mesocarnivores, riverine fish, invasive species), species/common name, photo, abundance, behaviour, habitat, and whether the sighting relates to restoration evidence.

Connectivity barriers: type (road, fence, dam, weir, culvert, etc.), photo, and a permeability rating (fully blocking / partially crossable / easily crossable / unknown), showing where human infrastructure interrupts wildlife movement.

Together, the layer builds a ground-truthed picture of two things at once: where key species (horses, dung beetles, wildcat, native fish, invasive species) are actually being seen and behaving, and where physical barriers constrain the movement corridors modelled in the resistance-surface/Omniscap connectivity pipeline.

As entries accumulate, this becomes the field-verification layer against the modelled base_layers resistance assumptions (roads, ruggedness, slope) and, longer term, feeds into both the connectivity notebooks and the Movement/Water/Connection StoryMap.
